Amendments to the Claims

This listing of the claims will replace all prior versions and listings.

Listing of Claims:

1. (Currently Amended) A method for controlling SO_3 in a combustion process of a sulfur-containing fuel utilizing selective catalytic reduction for the control of NOx emissions, the method steps comprising:

a) partially combusting the fuel in a first stage to create a reducing environment;

b) adjusting the reducing environment ~~for a time period~~ such that SO_3 is reduced to SO_2 prior to selective catalytic reduction to achieve a desirable level of SO_3 for optimizing precipitator function;

c) combusting the remainder of the fuel and combustion intermediates in a second stage with oxidizing environment; thereby controlling the levels of SO_3 in the flue gases.

2. (Original) The method of claim 1, further including the step of micro-staging the first stage fuel combustion.

3. (Original) The method of claim 2, wherein the micro-staging is provided through the use of low-NOx burners.

4. (Original) The method of claim 1, further including the step of macro-staging the first stage of fuel combustion.

5. (Original) The method of claim 4, wherein the macro-staging is provided through the use of over-fired air.

6. (Original) The method of claim 1, further including a combination of micro-staging and macro-staging.

7. (Original) The method of claim 6, wherein the micro-staging is provided by low-NOx burners and the macro-staging is provided by over-fired air.

8. (Original) The method of claim 1, wherein the fuel is coal.

9. (Currently Amended) A combustion furnace utilizing selective catalytic reduction for the control of NOx emissions and a precipitator, said furnace operated with a method for controlling SO_3 in a combustion process of a sulfur-containing fuel, the method steps comprising:

a) partially combusting the fuel to create a reducing environment;

b) adjusting the reducing environment ~~for a time period~~ such that SO_3 is reduced to SO_2 to achieve a desirable level of SO_3 for optimizing precipitator function;

c) combusting the remainder of the fuel in an oxidizing environment; thereby reducing the conversion of levels of SO_3 in the flue gases.

10. (Original) The method of claim 9, further including the step of micro-staging the first stage fuel combustion.

11. (Original) The method of claim 10, wherein the micro-staging is provided through the use of low-NOx burners.

12. (Original) The method of claim 9, further including the step of macro-staging the first stage of fuel combustion.

13. (Original) The method of claim 12, wherein the macro-staging is provided through the use of over-fired air.

14. (Original) The method of claim 9, further including a combination of micro-staging and macro-staging.

15. (Original) The method of claim 14, wherein the micro-staging is provided by low-NOx burners and the macro-staging is provided by over-fired air.

16. (Original) The method of claim 9, wherein the fuel is coal.

17. (Original) A method for controlling SO_3 concentrations in a combustion process of a sulfur-containing fuel, the method steps comprising:

a) partially combusting the fuel in a first stage to create a reducing environment;

b) adjusting the reducing environment time period such that SO_3 is preferentially reduced to SO_2 to achieve a desirable level of SO_3 for optimizing precipitator function;

c) combusting the remainder of the fuel and combustion intermediates in a second stage with oxidizing environment; thereby controlling the levels of SO_3 in the flue gases.

18. (Original) The method of claim 17, further including the step of micro-staging the first stage fuel combustion.

19. (Original) The method of claim 18, wherein the micro-staging is provided through the use of low-NOx burners.

20. (Original) The method of claim 17, further including the step of macro-staging the first stage of fuel combustion.

21. (Original) The method of claim 20, wherein the macro-staging is provided through the use of over-fired air.

22. (Original) The method of claim 17, further including a combination of micro-staging and macro-staging.

23. (Original) The method of claim 22, wherein the micro-staging is provided by low-NOx burners and the macro-staging is provided by over-fired air.

24. (Original) The method of claim 17, wherein the fuel is coal.
